Network Rack Cabling Redundancy

Overview

Redundant network wiring involves installing secondary cabling routes and alternative connection points to support continuous operation. If one cable or switch goes down, traffic is automatically rerouted through a backup system, keeping your operations online. It's really easy to get caught up in designing your network to have redundant links, dynamic and self-healing protocols that allow maximum throughput but completely ignore the actual infrastructure bit of it all. Any mishandl nd switching installations provide higher and higher levels of performance and capacity. But with this growth of capability come a parallel growth of discrete data communications and power c bling. This is the first time I'm attempting redundant switches. We have some NAS servers and three Proxmox servers that virtualise almost everything. What works: LACP provides. Written by Don Schultz, trueCABLE Senior Technical Advisor, Fluke Networks Copper/Fiber CCTT, BICSI INSTC, INSTF Certified All your permanent networking cable has been installed. What next?

You get to “wire up” the head end of your installation. MRP: Single-ring network with predictable switchover.
